
Title: Blackrock and its Kind

Author: Grant, Alchemist

Blackrock, perhaps the most dangerous of reagents, has been getting quite a bad reputation since those followers of armegeddon fellows came to town those many years ago. However research is still done on the remaining peices that are scattered in Sosaria. Should even one peice fall into the wrong hands history could repeat itself. Blackrock is an immense source of power, in fact it has the energy that the ethereal realm uses. It is a weightless reagent and is a dark shadow color, hence blackrock. Blackrock is not the purest form. The purest form of crystalline blackrock is very rare. There was only one report on it. Then it will go to blackrock and then blackmoore.

Blackrock is used in some spells, mainly death ones. However its main purpose was to be used for the Armegeddon spell. Blackrock has no counter-partner, that is to say nothing could be used against it. However its lesser form, blackmoore, hold much les of its higher brothers

power. Maybe 1000
blackmoore's would
equal one or even less
of one blackrock!
Blackmoore is used in
lesser spells but
dangerous ones none
the less. Many
necromancers seek out
such a reg for their
own experiments and
spells. Some such
spells include ones
that cause harm or
binding. Now unlike
blackrock, blackmoore
has a counter reagent,
belladonna or more
commonly known as
Nightshade.

Mandrake is used
for the uses where
blackmoore would be
used in these times.
Now, one may channel
the blackmoore's
energy into any spell
the caster wishes.
However, nightshade
can reverse its ability
of power by making
the blackmoore sick
and weak. A mixture
of four parts
nightshade poured onto
a blackmoore will
make the blackmoore
sick and throw up its
white fleshy insides
till its power is
removed. This can be
used for dispelling
purposes or
deflections. Now it
seems to me that when
grinded into a paste it
the bototm is ripped
